1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library
was normalized. Library was constructed by Life Technologies, a
division of Invitrogen. This sequence belongs to sequence cluster
1699.f

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prinend enriched, double-strand cDNA was digested with Not I and clone into the Not I and EcoRV sites of the pCMVSPORT 6 vector. Library was not normalized. Library was constructed by Life Technologies, division of Invitrogen.
                                                                                                                                                                                                                                                                                                                              1 (bases 1 to 905)

Email: seqref@genoscope.cns.fr, Web: www.genoscope.cns.fr
1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library
was normalized. Library was constructed by Life Technologies, a
division of Invitrogen. This sequence belongs to sequence cluster
1699.f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   σ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  For more information about this cluster, see http://www.genoscope.cns.fr/cdna?s=CSODIO63AGO3QP1&c=1699.f. This invention describes a novel method of preparing eukaryotic alkaline phosphatase in yeast cells, comprising cloning an alkaline phosphatase gene sequence into different vectors, transforming, and expressing and purifying. A first vector is used containing a resistance gene against a selection marker and transformants that have integrated resistance gene and alkaline phosphatase gene into the genome are selected by growth on medium containing a low concentration of selection marker. The gene copy number is increased by multiple transformation and multiple transformants selected marker is introduced, its copy number increased as for the first resistance gene and clones selected that have many copies of the alkaline phosphatase gene and of both resistance genes, integrated into the genome. The vectors used in the method are phARP10-3 and pHAP10-3/9K. Preferred cells include methylotrophic yeast, particularly Pichia pastoris and Hansenula polymorpha and specifically P. pastoris X-33 transformed with pHAP10-3 yand pHAP10-3/9K. The amino acid sequence of bovine alkaline phosphatase is known and, working back from this, an optimised codon sequence was designed. This was assembled conventionally from 28 synthetic oligonucleotides to give a sequence having EcoRI and App718 recognition sites at the ends to facilitate cloning. The selection markers are particularly zeomycin and G418, respectively. The alkaline phosphatase with specific activity over 300, preferably 1000, units/mg and heat stability comparable with that for commercial enzymes. The expression system is resistant and stable and provides high-level expression without any selection pressure. This sequence represents an optimised bovine biapil polynucleotide.

                                                     र्
                                                                                                                                                                                                                This invention describes a novel mutant of eukaryotic alkaline phosphatase where the wild-type sequence is at least 77% homologous with C ADE53385 and where the alkaline phosphatase activity is reduced by at least 100-fold, relative to the wild type. The mutations described are C least 100-fold, relative to the wild type. The mutations described are C Asp42, 316 or 357 for Asn, Val, Ala or Ser; Ser92 or 155 for Ala, Gly, C Val or Leu; Glu311 for Gln, Asn, Leu, Ile or Met; His320, 358 or 432 for Asn, Phe, Asp or Tyr; or Gly322 for an amino acid larger than Asp. C Conjugates of the novel mutant with antibodies are useful in alkaline phosphatase-based immunoassays for antigens as interference suppressors, i.e. they prevent non-specific binding of active alkaline phosphatase-C based conjugates to vessel walls or first antibodies, a phenomenon that may result in false positive results. The mutants have almost the same tertiary and quaternary structures as wild-type alkaline phosphatase, so tertiary appecific interference suppressors. This sequence represents a variant bovine alkaline phosphatase which includes an EcoRI site described in the disclosure of the invention.
                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ફ
                                                                                                       phosphatase where the wild-type sequence is at least 77% homologous with 2C ADE53385 and where the alkaline phosphatase activity is reduced by at 2C least 100-fold, relative to the wild type. The mutations described are 3C Asp42, 316 or 357 for Asn, Val, Ala or Ser; Ser92 or 155 for Ala, Gly, 3C Val or Leu; Glu311 for Gln, Asn, Leu, Ile or Met; His320, 358 or 432 for 3C Conjugates of the novel mutant with antibodies are useful in alkaline phosphatase-based immunoassays for antigens as interference suppressors, 3C i.e. they prevent non-specific binding of active alkaline phosphatase-3C based conjugates to vessel walls or first antibodies, a phenomenon that 3C may result in false positive results. The mutants have almost the same 3C certiary and quaternary structures as wild-type alkaline phosphatase, so 3C variant bovine alkaline phosphatase which contains an S92A mutation and 3C variant bovine alkaline phosphatase which contains an S92A mutation and 3C certiary and certiary and certiary and certiary and certiary and certiary structures as wild-type alkaline phosphatase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         믕
This invention describes a novel mutant of eukaryotic alkaline phosphatase where the wild-type sequence is at least 77% homologous with ADE53385 and where the alkaline phosphatase activity is reduced by at least 100-fold, relative to the wild type. The mutations described are Asp42, 316 or 357 for Asn, Val, Ala or Ser; Ser92 or 155 for Ala, Gly, Val or Leu; Glu311 for Gln, Asn, Leu, Ile or Met; His320, 358 or 432 for Asn, Phe, Asp or Tyr; or Gly322 for an amino acid larger than Asp. Conjugates of the novel mutant with antibodies are useful in alkaline phosphatase-based conjugates to vessel walls or first antibodies, a phenomenon that may result in false positive results. The mutants have almost the same tertiary and quaternary structures as wild-type alkaline phosphatase, so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             alkaline phosphatase; mui interference suppressor;

Claim æ •• SEQ. Z O 10; 35pp; German.

This invention describes a novel mutant of eukaryotic alkaline phosphatase where the wild-type sequence is at least 77% homologous with C phosphatase where the alkaline phosphatase activity is reduced by at least 100-fold, relative to the wild type. The mutations described are Rsp42, 316 or 357 for Asn, Val, Ala or Ser; Ser92 or 155 for Ala, Gly, C Val or Leu; Glu311 for Gln, Asn, Leu, Ile or Met; His320, 358 or 432 for Asn, Phe, Asp or Tyr; or Gly322 for an amino acid larger than Asp. C Conjugates of the novel mutant with antibodies are useful in alkaline phosphatase-based immunoassays for antigens as interference suppressors, i.e. they prevent non-specific binding of active alkaline phosphatase-c based conjugates to vessel walls or first antibodies, a phenomenon that my result in false positive results. The mutants have almost the same tertiary and quaternary structures as wild-type alkaline phosphatase, so are very specific interference suppressors. This sequence encodes a variant bovine alkaline phosphatase which contains an H320N/G322F mutation and an EcoRI site described in the disclosure of the invention.

This invention describes a novel mutant of eukaryotic alkaline phosphatase where the wild-type sequence is at least 77% homologous with C phosphatase where the alkaline phosphatase activity is reduced by at least 100-fold, relative to the wild type. The mutations described are C Asp42, 316 or 357 for Asn, Val, Ala or Ser; Ser92 or 155 for Ala, Gly, C Val or Leu; Glu311 for Gln, Asn, Leu, Ile or Met; His320, 358 or 432 for C Asn, Phe, Asp or Tyr; or Gly322 for an amino acid larger than Asp. C Conjugates of the novel mutant with antibodies are useful in alkaline phosphatase-based immunoassays for antigens as interference suppressors, C i.e. they prevent non-specific binding of active alkaline phosphatase-C based conjugates to vessel walls or first antibodies, a phenomenon that C may result in false positive results. The mutants have almost the same C tertiary and quaternary structures as wild-type alkaline phosphatase, so are very specific interference suppressors. This sequence encodes a variant bovine alkaline phosphatase which contains an S92A/H320N/G322F mutation and an EcoRI site described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New mutants of alkaline reduced a hundred fold, immunoassays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mueller

This invention describes a novel method of preparing eukaryotic alkaline phosphatase in yeast cells, comprising cloning an alkaline phosphatase (c) gene sequence into different vectors, transforming, and expressing and copurifying. A first vector is used containing a resistance gene against a selection marker and transformants that have integrated resistance gene and alkaline phosphatase gene into the genome are selected by growth on comedium containing a low concentration of selection marker. The gene copy number is increased by multiple transformation and multiple transformants selected on growth medium under high selection pressure. A second vector containing the alkaline phosphatase gene and a second resistance gene against a second marker is introduced, its copy number increased as for the first resistance gene and clones selected that have many copies of the alkaline phosphatase gene and of both resistance genes, integrated conton the genome. The vectors used in the method are phAplo-3 and phAplo-3/9K. Preferred cells include methylotrophic yeast, particularly Pichia pastoris and Hansenula polymorpha and specifically P. pastoris X-33 continued the phosphatase is known and, working back from this, an optimised codon sequence was designed. This was assembled conventionally from 28 synthetic oligonucleotides to give a sequence having EcoRI and CC hap718 recognition sites at the ends to facilitate cloning. The selection markers are particularly zeomycin and G418, respectively. The alkaline phosphatase with specific activity over 3000, preferably 10000, units/mg and heat stability comparable with that for commercial enzymes. The scyression without any selection pressure. This sequence represents the bovine biapii gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mueller R,

This invention describes a novel mutant of eukaryotic alkaline phosphatase where the wild-type sequence is at least 77% homologous with ADE53385 and where the alkaline phosphatase activity is reduced by at least 100-fold, relative to the wild type. The mutations described are Asp42, 316 or 357 for Asn, Val, Ala or Ser; Ser92 or 155 for Ala, Gly, Val or Leu; Glu311 for Gln, Asn, Leu, Ile or Met; His320, 358 or 432 for

Conjugates of the novel mutant with antibodies are useful in alkaline phosphatase-based immunoassays for antigens as interference suppressors, i.e. they prevent non-specific binding of active alkaline phosphatase-based conjugates to vessel walls or first antibodies, a phenomenon that may result in false positive results. The mutants have almost the same tertiary and quaternary structures as wild-type alkaline phosphatase, so are very specific interference suppressors. This sequence encodes the wild-type bovine alkaline phosphatase described in the disclosure of the

Also described is a method for providing mutant polypeptides or proteins are useful for sequence and providing mutant polypeptides or proteins are useful for optimising biomolecules and enzymes. The present sequence represents a calf intestinal alkaline phosphatase (ciap) DNA sequence, which is used in an example from the present invention for the recombination of human placental alkaline phosphatase (hpap) and ciap genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Forming a polynucleotide sequence for optimizing biomolecules and by generating a nucleic acid fragment ladder, removing the chainterminating molecules and reassembling the polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
